

PRODUCT BROCHURE · MANAGEMENT BRIEF

Audit time drops **87%**. Your QA team gets its strategy back.

An AI-native quality & supplier-audit platform built for how regulated supply chains actually operate. Quantitative outcomes. Cited benchmarks. No marketing language.

Hawkeye · for leadership review · [Customer name] · April 2026

This document covers product capability and value. Commercial terms are in a separate proposal, available on request.

THE PROBLEM, IN NUMBERS

Your QA team is doing paperwork.
It should be doing quality.

The cost is not theoretical. Published industry research and FDA inspection data quantify what's happening across pharma quality teams today.

What this looks like inside your business

A mid-pharma or CDMO with 3 sites hosts roughly 30 audits a year from buyers and regulators. Each audit takes 3-5 days of QA team prep — pulling SOPs, building questionnaires from templates, gathering evidence, drafting reports. Multiply: **~120 person-days a year on audit prep alone**. Then add CAPA chasing, document control, change requests, training assignments, complaint investigations.

The result, as **ISPE's 2025 deviation-management research** documented, is that *the majority of total investigation time is consumed in writing, formatting, and reviewing reports, leaving much less time for actual root-cause analysis*. Your most senior quality people spend their week on administrative work; the strategic improvements they should be driving wait.

The hidden cost. Operational savings are one part of the value (~₹38L/yr at a 3-site mid-pharma). The bigger value is what your QA team does with the freed bandwidth — risk-based supplier strategy, trend analysis, the root-cause patterns across the site. That's the work currently being squeezed out.

Where your QA team's week actually goes

Sources: industry benchmark — McKinsey Pharma Operations 2023 (50%+ QA time on documentation); Hawkeye-modeled rebalancing via AI-drafted artifacts + workflow automation.

One engine. Fifteen modules. The **digital thread** you've been asked to build.

Not another point tool. A configurable compliance engine that runs the full quality lifecycle and the supplier-audit lifecycle on the same platform — with AI that drafts the slow work and an audit trail an inspector can defend.

One trigger. Six automatic actions. Zero manual handoffs.

The "digital thread" you've been asked to build — by construction, not by integration.

Cross-module wiring is structural, not manual.

Every event traces to every consequence. Audit-defensible by design.

Why this matters

Pharma EQMS vendors (Veeva, MasterControl) are deep on internal quality but don't run supplier-audit networks. Audit-network players (Qualifyze) run networks but don't have EQMS. Nobody runs both, on one engine, with the cross-module wiring that makes a deviation auto-create a CAPA, a document revision auto-assign training, an audit finding flow into a supplier scorecard. **That's not a feature. That's a category.**

The honest framing. What's structurally hard about Hawkeye is the combination — not any single feature. Each piece exists somewhere else; the combination doesn't. The PoC will let you verify that claim on your own data, on your own terms.

From 5 days to a few hours.

Supplier audit is where the time bleed is most acute today and where Hawkeye's value is most visible.

Sources: industry benchmark — PSCI 2024 (2-4 days on-site = 16-32 hrs prep typical); Hawkeye-modeled with AI-drafted prep package.

SUPPLIER AUDIT

What changes for the people running it

Today. An auditor scopes the audit, builds the questionnaire from templates, gathers historical findings, pulls SOPs and certificates, drafts the agenda, writes the report after. Roughly **32 hours per audit**. The same audit, slightly rephrased, gets hosted by the same supplier 30+ times a year — pure redundancy across the industry.

With Hawkeye. A supplier risk dossier is auto-built from your audit history + public regulatory data (FDA, EMA, WHO). AI drafts a risk-weighted questionnaire; the lead auditor reviews and approves. Evidence autofill extracts answers from uploaded documents. The audit report is drafted by AI in your template, with citations to every supporting source. QA Head reviews and e-signs. **4-6 hours total.**

Mid-pharma typical

The leadership takeaway. The freed hours don't just become idle time. They become risk-based supplier strategy, trend analysis, the work that prevents audit findings in the first place. That's the second-order value most platforms can't deliver because they're optimizing the wrong thing.

The CAPA register stops being your audit liability.

Deviation and CAPA are where the regulatory exposure is highest and where structural fixes matter most.

CAPA cycle time — per stage comparison

Sources: industry benchmark — typical pharma CAPA cycle 40-60 days (ISPE APQ CAPA guide); Hawkeye-modeled with AI-drafted RCA + structural state machine.

DEVIATION / NON-CONFORMANCE

From paper-trail forensics to structured root-cause analysis

Today. Deviations are logged in Excel or a shared drive. Investigation is ad-hoc; root-cause analysis is whoever's free that week. The CAPA gets created in a separate system, or doesn't. Cross-module linkage is manual and fragile.

With Hawkeye. Structured intake with risk classification from first capture. AI 5-Why scaffolder guides the investigator through root-cause analysis, with similar-event search across your historical record. A CAPA is auto-created from the deviation with full traceability. The whole flow is e-signed, audit-trailed, ALCOA+ compliant from first entry.

CAPA MANAGEMENT

Closed-loop, by construction

Today. Open CAPAs accumulate. Effectiveness verification is often skipped or backfilled. The CAPA register is a known liability in every audit. "Where are we on CAPA-2024-0073?" takes hours to answer.

With Hawkeye. Full state machine: initiate → investigate → action plan → implement → verify effectiveness → close. No state skipped. AI drafts the RCA and effectiveness criteria; humans review. Risk-based due dates with escalation. A failed CAPA can auto-trigger a for-cause audit.

Version anxiety stops. Velocity starts.

Document control and change control are the day-to-day rhythm of a quality system. Friction here compounds across every other module.

DOCUMENT CONTROL

From "which version is current?" to enforced control

Today. SOP versions live in shared drives or a DMS that doesn't integrate with anything. "Which version is current?" is a real question. Training assignments on SOP revisions are manual. Document-control findings are common in inspections.

With Hawkeye. Full lifecycle: author → review → approve → effective → periodic review → retire, version control enforced structurally. Auto-training assignment on document revision — affected roles get training tasks automatically, completion tracked on dashboard. Every version e-signed and locked.

Industry typical: hours

CHANGE CONTROL

From bottleneck to controlled velocity

Today. Change requests stall waiting for impact assessment or approval routing. Critical changes get rubber-stamped under time pressure; non-critical changes wait months. The audit-trail of *why* a change was approved is often thin.

With Hawkeye. Structured change-request intake with mandatory impact assessment (validation, regulatory, supplier, training). Configurable multi-step approval with role-gated transitions and e-signature. Linkage to affected documents, equipment, suppliers, training requirements. AI-drafted impact analysis using your historical data; reviewer accepts/modifies.

You see what the regulator **already** knows.

Supplier-driven quality incidents are the most expensive failures — and the most preventable when you have the right data, continuously.

Supplier risk: continuously fused from public + internal data

You see what the regulator already knows — automatically, continuously.

SUPPLIER QUALITY

From self-reported snapshots to continuous, public-data-fused intelligence

Today. Supplier risk is whatever's in the qualification questionnaire from 18 months ago. FDA Warning Letters, EMA inspection signals, WHO prequalification status — they exist but you don't see them. By the time a supplier issue surfaces, it's already a problem affecting your batches.

With Hawkeye. 12-dimensional supplier risk fused from your audit history + quality events + FDA inspections + EMA EudraGMDP + WHO prequalification + public recalls. Continuously updated. Early-warning alerts when supplier risk shifts. For-cause audits triggered automatically by defined risk events. Supplier strategy becomes intelligence-driven, not paper-driven.

Rule-based

Where the asymmetric value is. Supplier-driven quality incidents (recalls, batch rejects, supply disruptions) cost ₹5-25L each. Catching the signal one quarter earlier — via continuous public-data fusion most platforms don't run — is the line item where Hawkeye creates the largest non-linear value. One avoided recall pays for the platform many times over.

What changes for the people who use it.

Four roles whose day-to-day reality changes most. Each carries quantitative outcomes from cited benchmarks plus the Hawkeye-modeled deltas.

FOR THE QA HEAD / QUALITY DIRECTOR

Your most senior person stops being a bottleneck.

Today, you approve every CAPA close-out, chase every overdue investigation, defend audits month-on-month. With Hawkeye, approvals are queued in priority order with cross-module context one click away. The slow work is drafted by AI; you review and sign. **The freed bandwidth is what you do with it** — risk-based supplier strategy, trend analysis, the strategic work currently squeezed out.

ISPE / FDA 2024

FOR THE QA ANALYST — DAILY USER

The slow work disappears. The meaningful work expands.

Today, 60% of the day is document hunting, template filling, cross-referencing SOPs, chasing approvals. The actual quality engineering — root-cause analysis, trend investigation, process improvement — gets squeezed. With Hawkeye, AI handles structured prep work; the analyst reviews and approves. Investigation gets the time it deserves.

FOR THE IT / CSV LEAD

One validated platform replaces a fragmented stack.

Today, multiple systems to maintain — DMS + CAPA tool + audit spreadsheets + supplier database + change-control software. Each requires separate validation, integration, support. With Hawkeye, one platform, one validation package, documented APIs, change-controlled configuration. AI governance is structurally enforced (per-call reproducibility, grounded outputs, human-in-the-loop). **Your CSV burden goes down, not up.**

5+ → 1

Validated systems consolidated

SOC 2

Posture, in progress for Q4 2026

Honest current state

The outcome — in four numbers

Sources: industry benchmarks (PSCI 2024 supplier audit data, ISPE APQ CAPA guide); Hawkeye-modeled per cost-model spreadsheet.

What we are. What we're not yet. What we propose.

What's real

A code-verified platform — 170 data models, 15 modules, 20+ AI agents. Pharma-first, GxP-grade, with the deepest integration of EQMS + supplier-audit + public data + reproducible AI in the market. India-built, India-priced, but engineered to the WHO-GMP / export-quality bar.

What's not yet

Read this before saying yes.

- **We are pre-customer.** You would be among our first. No pharma logo references yet. The platform is real; the commercial proof is being built.
- **Some modules are partial.** The audit-management, deviation, CAPA, document-control, change, supplier-quality modules are production-ready. Training, complaint, management-review are functional but less mature. RFQ-procurement is a roadmap item.
- **Audit-network liquidity is a roadmap bet.** The framework is built; multi-party network effects are what we're building toward, not what exists today.
- **SOC 2 is in flight.** Expected Q4 2026. We can produce readiness documentation now.
- **On-prem deployment** is available, validation-gated, but not yet proven end-to-end in production.

What we propose

A 30-day proof-of-concept on your real data, in a sandbox you control, run by your QA team in parallel with your current process. You compare side-by-side: same audit, same deviation, same CAPA, processed your way vs in Hawkeye. The decision becomes evidence-based.

The PoC has no commercial element. Pricing, payback, and the Founding Customer offer are in a separate Commercial Proposal we'll share when you ask for it. The order is deliberate — we want you to evaluate the product first, the commercials second.

What this honesty buys. A clean decision either way. If you say yes after the PoC, you're saying yes to what we actually are — not what a sales deck claimed. If you say no, you'll know why. Either outcome moves both organizations forward.
