

# The compliance engine for regulated supply chains.

We're raising \$3M to take a code-verified, AI-native quality & supplier-audit platform from pharma-proven to cross-industry. Here's why now, what we've built, and what we want to do with your money.

## THE PROBLEM WE'RE SOLVING

Pharmaceutical contract manufacturers host ~30 quality audits a year from buyers and regulators. Each takes 3-5 days of preparation by a quality team of 5 or 6 people. The work is overwhelmingly manual: pull SOPs from binders, build questionnaires from prior templates, gather batch records, draft reports. There is almost no reuse between audits, even for the same supplier. The same supplier hosts the same audit, slightly rephrased, dozens of times a year — once for each client. It's **structural redundancy at industrial scale**, and the existing software does little to fix it.

The pain is not unique to pharma. Food safety, medical devices, automotive, aerospace, chemicals — every regulated industry has the same shape of problem: collect evidence, validate against a standard, generate a compliance report, prove the record is unaltered. The standards differ; the motion is identical.

## WHAT WE BUILT

A configurable compliance engine that runs the full quality lifecycle *and* the supplier-audit lifecycle on one platform — with AI that drafts the slow work and a per-call audit trail that makes every AI output reproducible for a regulator. Specifically:

- **170 data models, 15 modules, 20+ AI agents.** Document control, deviation, CAPA, change, training, risk, management review, plus the full supplier-audit lifecycle. Cross-module wiring so a deviation auto-creates a CAPA; a risk event triggers a for-cause audit; an audit finding flows into the supplier scorecard. **Nobody else couples these.**
- **AI an inspector can defend.** Every AI output cites its source, records the prompt + model + confidence, and is signed by a human. Per-call reproducibility — not a black box. SHA-256 tamper-evident records and an append-only audit trail are built in from day one.
- **Live public-data fusion.** FDA, EMA, WHO inspection data streams continuously into supplier risk profiles. Most platforms still use self-reported, point-in-time data.
- **Industry-agnostic by design.** Standards are data, not code. The five-pillar engine — collect, process, validate, generate report, seal record — runs the same for any regulated supply chain. We started in pharma because pharma is the hardest regulatory bar; the engine inherits everything every other industry needs.

## WHY NOW

Three converging shifts:

- **AI is finally defensible in GxP.** Grounding, citations, and emerging standards like ISO 42001 mean AI in regulated environments is sellable for the first time. Two years ago it wasn't.
- **The standards themselves are converging.** ISO 9001:2026, aerospace's IA9100, automotive's IATF 16949:2027 are all re-aligning to a common spine with vertical clause-packs on top. The regulatory world is moving toward exactly the engine-plus-config architecture we built.
- **The cross-industry seam is unowned.** Vertical incumbents (Veeva, MasterControl) are pharma-deep but can never abandon their vertical moat to go horizontal. Audit networks (Qualifyze) are network-only with no EQMS. Nobody runs both, across industries.

## MARKET

**\$12.5B**

QMS market (2025) growing 10-11%; \$20-31B by 2030

**\$15.5B**

Supplier-quality apps (2026); \$42B by 2036

**13.8%**

Life-sciences CAGR — fastest-growing vertical

We won't beat Veeva at being Veeva — and we won't try. The beachhead is the underserved edge of pharma: small and mid-sized manufacturers, emerging-market exporters, India's contract manufacturing base. Roughly \$200M+ TAM just in India, where we have a real cost advantage. From there we expand ring-by-ring outward — Food & Beverage next (architecturally near-identical to pharma supplier audit), then cosmetics and blood/tissue, then automotive and aerospace via the supplier-audit angle on the back of the ISO 9001:2026 convergence.

## WHY THIS IS HARD TO COPY

No single feature is the moat — the **combination** is. Each piece exists somewhere; the combination doesn't:

- Full EQMS depth *plus* supplier-audit coupling (incumbents have one, not both)
- Per-call reproducible AI built for the inspector, not the marketing slide
- Live public-data fusion into continuous supplier risk
- An industry-agnostic engine — vertical incumbents structurally cannot build this without abandoning their moat
- Affordability for SMBs and emerging markets the premium tier prices out

## THE HONEST PART

**What's real today:** the pharma plug-in is shipped — five pillars verified in code, e-sign + ALCOA+ audit trail working, AI agents drafting questionnaires and reports, public data fusing into risk scores. **What's still ahead:** design partners → first paying customers, SOC 2, on-prem LLM proven end-to-end, the live shared-audit network (a roadmap bet, not built yet), and the first non-pharma config pack. We are pre-customer. The product is real; the commercial proof isn't yet.

## THE TEAM

[Founder name(s) and backgrounds. Specific credentials in pharma quality, software engineering, AI/ML, and prior companies. Named advisors with concrete domain authority. The verified code repository — 170 data models, the five-pillar architecture, the cross-module wiring — is the evidence of what this team can ship.] *[ Filling this section in with real specifics is the single most important thing before sending this memo. Team is the #1 driver of a pre-seed decision. ]*

## THE ASK

**\$3M**

Pre-seed / angel round to extend runway to 18-24 months and earn the Series A on real numbers.

**40%** Product & engineering**35%** GTM & design partners**15%** Compliance & validation**10%** Reserves

**Milestones we'll hit by Month 18:** 20+ paying pharma customers, first reference deployments, first Food & Beverage design partner, SOC 2 in flight, and ARR run-rate to justify a Series A on real numbers — not narrative.

**[ Founder name ]**

Founder &amp; CEO, Hawkeye

If this is interesting, the pitch deck has the full picture and the master reference doc has every detail you'd want for diligence. I'd love 30 minutes to talk.
